

Proof

▶ suppose $T' = 0$

ie given any $\psi \in W'$

$$T'(\psi) = \psi \circ T = 0$$

▶ suppose $T \neq 0$, ie $\exists v$ such that $Tv = w \neq 0$

▶ since W is finite dimensional,

$$w = c_1 w_1 + \dots + c_m w_m$$

where w_1, \dots, w_m is the basis and c_1, \dots, c_m is some scalar

▶ since $w \neq 0$, at least one $c_i \neq 0$. Pick ψ such that

$\psi(w_i) \neq 0$, which must exist by 3.98

$$\begin{aligned} \text{▶ } 0 &= (T'\psi)_v \quad \begin{array}{l} \nearrow \text{by definition} \\ \downarrow \text{by hypothesis} \end{array} \quad \psi \circ Tv = \psi(w) \quad \begin{array}{l} \nearrow \text{by basis definition} \\ \downarrow \text{by hypothesis} \end{array} \\ &= \psi(c_1 w_1 + \dots + c_m w_m) \quad \begin{array}{l} \nearrow \text{by basis definition} \\ \downarrow \text{by linearity} \end{array} \\ &= c_1 \psi(w_1) + \dots + c_m \psi(w_m) \end{aligned}$$

▶ $\psi(w_i) = 0 \Rightarrow \text{contradict. Thus } T = 0.$
